

My intention with this final project is to create a bot to take in stories, such as the ever popular tragedy of Darth Plagueis the Wise and have it return its own story as such. I was inspired by an older attempt at something similar except based on the Harry Potter books (shown here: <https://botnik.org/content/harry-potter.html>). As a result, I hope to achieve an output that is at least somewhat amusing, if only from the perspective of the culture surrounding Star Wars Prequel memes.

To do so I intend to use Word2Vec in order to transmit the texts of my choosing into a system that a neural network can actually use, and to facilitate word association. I also intend to compare this to a more low level version of a similar technology using N-grams and look at the output from both to see which produces more coherent, or funnier results.
